Our Oriental Seeds are produced in our own gardens in Japan and China under a great care and personal control, and they are imported directly from these countries into our hand. We guarantee the quality to be pure and strong in vitality with high germination.

GUARANTEE OF SATISFACTION—We positively guarantee all seeds and plants sold by us to be exactly as described in this catalog, and free from disease and insect pests. We also guarantee them true-to-name, and will replace, free of charge, any that may prove otherwise through a possible error.

While we guarantee all seeds and plants to reach you in good growing condition, we do not guarantee crop, and cannot be held responsible if later the plants fail. The life of a plant after it reaches the planter in good condition depends entirely upon conditions over which we have no control. A tree, shrub or other plant is a living organism, as much as a cow, horse or man. It breathes, drinks and feeds, and is subject to attacks of disease and insects. Even with our superior quality seeds and plants, success depends largely upon cultivation, soil and weather conditions, so it is therefore agreed that in no case shall the Oriental Seed Co., be liable for more than the original purchase price.

Acres of Chinese Cabbage on Our Paoting-fu Farm in Chili, China

Chinese Cabbage 支那白菜

(Chinese Celery Cabbage)

This exceptionally fine vegetable is of the cabbage family from china and possesses some distinguishing characteristics which place it, as a cabbage, in a class entirely by itself. In shape it is unlike any other familiar type of the cabbage family. Its habits of growth resemble Cos-lettuce, while the outer leaves, except in their elongated shape, resemble ordinary cabbage leaves in general texture. When the outside leaves are stripped away we see an appetizing picture of lettuce and celery combined, presenting a cool, crisp, inviting appearance well-nigh irresistible.

Shredded and served raw, it outclasses the finest cabbage slaw, or with dressing the best raw cabbage salad; its tenderness

and mild flavor make it peculiarly appetizing. It may also enter into a combination salad, by stripping the leaves from the central stalks and cutting up the stalks as with celery, for which it makes an excellent substitute. The stalks, when stripped, appear like celery and will be eaten with an equal zest. When cooked in any of the ways in which ordinary cabbage is used, it not only equals, but, in some respects, surpasses the latter.

The culture is the same as for spinach or lettuce. The seed should be sown any time after May, and for main crop from July to September, $\frac{1}{2}$ inch deep in the row and rows about 24 inches apart. When the plant has grown up 5 to 6 inches thin out to 10 inches apart. Cultivate well and when large enough they should be blanched by earthing up and tying closely with burlap. Any good soil is sufficient, but they seem to head up best in rich black adobe soil. One ounce of seed is enough for 500 feet of drill.

“PAOTING” (genuine “WONG-BOK”) Registered brand (銹球白菜) - Big compact tender and crisp. An excellent “Wong-Bok.” We have found this to be absolutely the best firm-headed “Chinese Cabbage” to grow during the summer months. It will not scald or burn and will make a head when other varieties fail. It somewhat resembles “Kinshu” in shape and “Shantung” in character of leaf, color and size, but the head is more tightly compacted. It will produce a head of 15 pounds and will stand long before bolting to seed. It is excellent in quality; crisp, tender and brittle, with a fine celery flavor. We recommend it either for the market gardener, trucker or private planter, as it is a perfect “Chinese Cabbage” in every respect, not only being in the largest size, but of handsome color and of the finest quality. It is probably the safest variety for an amateur to plant, as it does well at all seasons and one is almost sure of getting a crop. It is vigorous and free from insects. (Pkt. 10c.) (Oz. 50c.) (4 Ozs. \$ 1.50) (lb. \$ 5.00) (2 lbs. \$ 8.00) postpaid. This seed grown in our Paotingfu Farm, in Chili, China.

Col repollo **CABBAGE** (キャベチ) 甘 藍 カンラン

It is difficult to give definite cultural directions for cabbage, since it is possible to have good cabbage at all seasons of the year in some part of the country. Seed may be planted almost any time of the year. However, there are the seasons preferable for sowing—in September for early spring cabbages, from January to April for summer and fall cabbages, and July to August for winter cabbages. Sow the seed $\frac{1}{2}$ inch deep and transplant the early varieties to rows 24 inches apart and 18 inches apart in the rows. They will mature in about 105 days. The late varieties mature in about 150 days and should be planted in rows 30 inches apart and 24 inches apart in the row. To prevent the heads from splitting open before they are ready to be harvested, the plants should be loosened a little at the root. Cabbages require plenty of moisture, but too much water causes them to rot very readily.

Brussels Sprouts
(子持キャベジ)

BRUSSELS SPROUTS (子持キャベジ) *Berza de Bruselas*

Brussels Sprouts are more hardy than cabbage, and in mild climates may remain in the open ground all winter, the heads being removed as desired. For winter use in cold localities, take up plants that are well laden with heads and set them close together in a pit, cold frame or cellar, with a little soil around the roots.

One ounce will produce 1,000 plants and will mature in about 150 days. Sow as directed for cabbage, and set the plants in rows 2½ feet apart and 2 feet apart in the rows. They require a long season of growth, but with suitable soil and liberal manuring an excellent crop of this vegetable can be secured. Cultivate the same way as cabbage.

TOKYO DARK GREEN CLIMBING CUCUMBER

Black Spine. The vines attain twice the length of common varieties. Young plants are bushy, but as soon as they are well established begin to throw out runners and climb, so may be grown on fences, poles or trellises, thus saving much valuable space in small gardens. Fruits 9 inches in length by 2½ inches across when mature, of fine green color; flesh is thick and firm, never bitter, a superb variety for slicing. When young, makes fine pickles. Very prolific; fruits are raised well above the ground so seldom suffer from wet weather or insects. Vines are almost mildew-proof and continue in bearing until late in the season. This excellent climbing variety is noted for standing hot dry summers without serious harm and so is well adapted to Southern climate. It also does well north. If kept picked, the vines will bear freely all season and retains deep green color of the skin for a long time after picked. (Pkt. 10c.) (Oz. 35c.) (4 Ozs. \$1.00) (lb. \$3.50) postpaid. Imported Seed.

"ORIENTAL'S CHINA-LONG"

A most remarkable and handsome new long green out door cucumber from China. The most fleshy and finest flavor of the long green type. The vines make a tremendous growth. They are unusually vigorous, bearing an enormous crop. The foliage is rich dark green and is quite resistant to diseases and insect attack.

ORIENTAL'S CHINA-LONG makes perfectly straight fruit. They average about 20 inches. They are thickest in the middle of fruit, where they average 2 to 3 inches in diameter. The attractive fruit taper gently toward the ends, holding their thickness well until they run off into a round stem and blossom end.

The skin of the fruit is a beautiful rich dark green set with a number of the characteristic long green. We have many enthusiastic letters from customers who have proclaimed it the most beautiful and best of all long green cucumbers. A most remarkable feature of **ORIENTAL'S CHINA-LONG** is the fact that it retains the beautiful deep green color of the skin until it is fully ripe.

ORIENTAL'S CHINA-LONG is practically all flesh, containing but very few seeds. The thick flesh is a beautiful white. It is crisp, juicy, and of the most delicious flavor, and essentially a qualified cucumber which is absolutely unequalled for market or home use.

The fine large long fruits are extra fine for slicing, but if picked when of small size, they make tasty little pickles. The people in China store surplus products for their winter table after cutting into four or five pieces and drying. The vigorous vines bear continuously, particularly if the fruit is picked as soon as it has reached a good size.

We recommend this novelty cucumber as much the best of all, and the variety anyone should plant. This seed grown in our Paotingfu Farm in Chili, China. (Pk. 10c.) (Oz. 50c.) (4 Ozs. \$1.75) (lb. \$5.00) postpaid. Imported Seed.

JAPANESE CARROT (日本人參)

Japanese Carrot, used raw, fried, boiled or stewed, used alone or combined with other vegetables or meat is not surpassed in nutritious healthfulness by any vegetable catalogued. Although these are hardy, after the plant is established, it is difficult to get a good stand unless the soil is well prepared, and of such a nature that it will not bake, for the seeds are small and slow to germinate. Carrots are sown all the year round in deeply tilled sandy, loam soil. Sow one inch deep in rows 15 to 20 inches apart. Thin out to 4 inches apart when plants are 2 inches high. Keep well cultivated and irrigate very often. Two and a half pounds will sow an acre. One ounce to 150 feet of drill.

CHAYOTO チャヨテ (準人瓜) 一個送費共五十仙

CULTURAL DIRECTIONS—One fruit envelopes one seed, which sprouts from the large end. Plant where you intend it shall grow. Cover only the large end, leaving the small end exposed. (See Picture.) Or let the fruit lie around until it has well sprouted, and then plant the seed, leaving the sprout well above ground. Water freely and do not be alarmed if frost should destroy it. A new shoot will soon appear. Give it abundance of water throughout the hot summer season.

The vine is a rampant grower. The first year from seed it will grow twenty to thirty feet. Destroyed to the ground by frost, it soon sends out new growth, and during the second season will extend vines forty or fifty feet in every direction. During September it starts blooming, having a small, white, insignificant flower, Within four weeks the fruit is large enough for the table. One vine in two years if properly trellised will produce more than one thousand fruit. 50c, each postpsid.

MUSHROOM SPAWN (茸の種子)

CULTURAL DIRECTIONS

Ten pounds will spawn about 10 feet square. Mushrooms can be grown in any dark room or cellar where the temperature can be kept at from 50 to 70 degree. From some old pasture procure good, rich soil, and to every bushel of this soil add 2 bushels of fresh horse manure. Of this well-mixed compound prepares a bed, say, 4 feet wide. Put down a thin layer and pound it down hard, and go on until you have a bed 12 or 18 inches thick. As soon as the temperature of the bed falls from 75 to 50 degrees, the spawn may be inserted in pieces about the size of a walnut, about 2 inches deep and 6 inches apart. Cover with loamy soil about 2 inches deep and beat it down evenly and firmly. Finish off with a covering of clean hay, about a foot thick, and the work is done. If the temperature is right, in 6 or 8 weeks you may expect mushrooms. The beds will continue bearing from 20 to 30 days. After the first crop is gathered spread over the bed an inch of flesh soil, moisten with warm water, and cover with hay as before. The main conditions in mushroom growing are proper and uniform temperature and very rich soil.

Klondike Watermelon
(クロンダイク ウオタメロン)

KLONDYKE—A great favorite of recent introduction. Oblong, dark rich green, flesh bright red, very crisp and sweet. We first offered the Klondike watermelon in 1914. It gained in popularity each year, first in one market then another. On account of the thin rind and extreme crispness the shipper was slow to accept it. But its extreme popularity impelled the shipper to grow it. Each year a larger acreage was planted, bringing greater profit to the grower. Although having a very thin rind it is a better shipper because it does not wilt. We now feel that the Klondike has fairly won the title. "The Prince of all Watermelons." The seed is small. One pound of Klondike will number as many seeds as two pounds of other varieties. The color of the seed is brown, mottled black. (Pkt., 10c.) (oz., 25c.) (¼ lb., 85c.) (lb., \$2.50) (2 lbs., \$4.00)

ONIONS (アニオン) Cebolla 玉葱

Onions are extremely hardy and will grow in any soil. No special knowledge or care is required, providing the soil is kept loose, and naturally onions, like anything else, will do better in good rich soil well drained. For extra early onions the seed should be sown in beds from August 1st to October 1st. Transplant when they are as large as lead pencils 5 inches apart, in rows 15 inches apart during December and January, as the plants will be large enough by that time.

PARSLEY *Perijil* (パセリー)

PLAIN or SMOO-LEAVED—This variety has a richer parsley flavor than the curled varieties and should be preferred for the home garden. It is not profitable to the market gardener for the reason that the curled variety will produce much more per acre. (Pkt. 10c.) (oz. 20c.) (¼ lb. 45c.) (lb. \$1.25) postpaid.

It is quite hardy, but should be protected by a thin mulch or hay or straw. Will produce more tender, sweet, blanched, white midribs by carthing up. (Pkt. 10c.) (oz. 20c.) (¼ lb. 60c.) (lb. \$1.75) postpaid. Imported Seed.

Parsley (パセリ)

PEPPERS *Pimiento* (ペツパー)

CULTURE—Peppers are tender and require to be raised in the hot bed. Seed should be sown from December to February, and when large enough transplanted into the ground in rows from one and one-half to two feet apart, and a foot and a half in rows. Sow in open ground during July and August for Fall crop. There are more Peppers raised here than in any other section of the country; the hot varieties are used for seasoning and making pepper sauce, the mild varieties are highly esteemed for salad. Care should be taken not to grow two different kinds close together as they mix very readily. Matures in 95 to 130 days. Four ounces will produce 1,500 plants; 4 ounces to the acre.

SUNNYBROOK, or IMPROVED SWEET CHEESE—The outstanding feature of this Pepper is its unusually fine flavor. In appearance, quality and flavor it is almost identical to the much advertised Topepo, which is erroneously reported to be a cross between Stone Tomato and Ruby King Pepper. It is a much more satisfactory variety than the Topepo ripening much earlier and averaging much larger in size. It is in great demand in all localities where it has been introduced. (Pkt., 10c.) (3 pkts., 25c.) (oz., 60c.) (¼ lb., \$1.80) (lb., \$6.00) postpaid.

Plant single or double rows from four to six feet apart, according to the different heights, about an inch apart in the row and three inches deep; hoe often. A loose, light soil, especially sandy loam, is desirable for a long, smooth root. In stiff soils the roots are usually uneven and hard to dig. Use one ounce for 100 feet of row, and thin to two inches to prevent crowding. Plant in 12-inch to 15-inch rows.

MAMMOTH SANDWICH ISLAND—The improved large-rooted variety, growing about 12 inches long and being from 1 to 2 inches thick. (Pkt, 10c.) (Oz. 30c.) (1/4 lb. 90c.) (lb. \$ 2.75) postpaid.

The big money maker as it is easy pays \$300.00 an acre in one season. It throws from the crown about a dozen leaves which grow 10 to 15 inches high, and 2 to 3 inches wide. The plants are pulled and bunched, however, when only about four inches tall. It is less effected by unfavorable climatic variations and dry weather than other Spinaches, to which it is equal in flavor and succulence. (Pkt. 10c.) (Oz. 20c.) (1/4 lb. 50c.) (lb. \$1.50) (2 lbs. \$2.40) postpaid. Imported Seed.

TOMATO *Tomate* (トメート)

(サンノゼ キャンナー)
San Jose Canner Tomato

For early plants sow in hotbeds early in March or April, in drills 5 inches apart and $\frac{1}{4}$ inch deep; when the plants are about 2 inches high, transplant into another hotbed 4 inches apart each way; plant out in the open ground early in May, or as soon as danger from frost is over, 4 feet apart each way in hills, which should have a shovelful of well-rotted manure mixed with the soil. Water freely at time of transplanting, but after the plants are well established water sparingly and at the roots only, as spraying the vines and overwatering causes the blossoms to drop off; when the first fruit is set, pinch off the ends of the branches to obtain early fruit. Sufficient plants for a small garden can be grown in a shallow box by placing it in a sunny window in a warm room. For late use sow in a sheltered border in May, and set out the plants in July; the green fruit can be picked off before frost and ripened under glass. By training the vines on trellises or trying to stakes, the fruit will ripen better and be of finer quality. The fruit matures in 150 days.

SAN JOSE CANNER (サンノゼキャンナー)—Smooth, solid, very large fruits, which are nearly round of slightly flattened, and grow very uniform in size and shape. Its fine quality, splendid shape, large size and its great productiveness have made this late variety almost a standard sort of red tomato for main crop use. (Pkt. 10c.) (oz. 75c.) ($\frac{1}{4}$ lb. \$2.50) (lb. \$7.50) Postpaid.

MORSE'S SPECIAL EARLY No. 498. (モース スペシャル 早生)—Without question this is the best extra early tomato ever offered for home garden, market garden or shipping. The fruit is scarlet, very smooth and almost globular. Flesh is wonderfully firm, free core and contains very few seeds. Size and shape just right for packing and the tough skin makes it carry well and peel easily. (Pkt. 15 cts.) (oz. \$1.35) ($\frac{1}{4}$ lb. \$4.00) (lb. \$12.50) postpaid.

TROPHY (トロフィー)—An old favorite and much esteemed for its productiveness and hardness. Our stock is the Improved Trophy, a smooth, bright scarlet. (Pkt. 10c.) (oz. 40c.) ($\frac{1}{4}$ lb. \$1.25) (lb. 4.00) postpaid.

CHALK'S EARLY JEWEL (アレージェウエル)—The largest, smoothest, and finest-flavored extra early bright red Tomato! Within a week to ten days as early as Sparks' Earliana, it is even a heavier cropper, with tomatoes of larger size and sweeter flavor, produced continuously throughout the season. The plants are of strong, robust growth, with ample foliage to protect the fruits from sunscald, and not likely to blight. The bright scarlet fruits are smoothly round, very deep, and solidly meaty, with only a few quite small seed-cells, and of remarkably fine sweet flavor. (Pkt. 10c.) (oz. 40c.) ($\frac{1}{4}$ lb. \$1.35) (lb. \$4.00) Postpaid.

DWARF CHAMPION—A dwarf variety, sometimes called the "Tomato," on account of its upright growth and its ability to stand alone without trellising. Fruit medium-sized, smooth, uniform, and of a purplish carmine color. (Pkt. 10 cts.) (oz. 50 cts.); ($\frac{1}{4}$ lb. \$1.50) (lb. \$5.00) postpaid

If we were to plant but one variety of tomatoes it would be the Matchless. (Pkt. 10c.) (oz. 40c.) ($\frac{1}{4}$ lb. \$1.35) (lb. \$4.00) postpaid.

For succession, continue to sow every two weeks until June; for fall and winter crop, sow in July and August. The Ruta Bagas are grown for feeding stock, and are also excellent for the table. Take up the roots in November, or before severe frosts; cut off tops within an inch of the crown, store in cool cellar or pit, or pile up in a conical form, out of doors, in dry ground; cover carefully with long straw, and finish by earthing up, covering them with about 12 or 15 inches of earth, leading a trench around the heap to carry off the water. Put away in this manner, they will be found in good condition in spring.

NEW JAPANESE SHOGOIN TURNIP かぶ

We are glad to recommend this splendid new Turnip. It is the best combination variety for both bulbous root and tops for "greens" that we have yet seen. Furthermore, it is Louse Resistant and it holds its heavy crop of leaves up off the ground. The bulbs or roots are all white, resembling Purple Top Globe in shape except flatter on top; sweeter and milder than other Turnips, of excellent flavor, tender, fine grained and extremely popular with those who have tried it. The tops or leaves are large, thick, juicy, very succulent, tender and of finest mild turnip flavor.

New Japanese Shogoin Turnip 聖護院大かぶ

With our crop on the Plantation in 1928, planted in hottest and driest summer, we were impressed with its ability to get a start and withstand the hot, dry weather even by young plants. It likewise stood the cold and washing winter and spring rains and produced a fine crop. There was no louse or other insect attacks on our crop.

Where no insecticide spraying was done on the truck farm, our Shogoin Turnip barely showed any signs of louse while Purple Top Globe, planted next to it, was practically eaten up by louse attacks and was a total loss. You will surely want Shogoin if you plant Turnips. Order at least a small quantity for this summer and fall plantings and see for yourself just how fine for all purposes this new Japanese Turnip really is. Packet, 10c. Oz., 20. (1/4 lb. 50c.) (lb. \$1.50) (2 lbs. \$2.00) (5 Lbs., \$4.50) postpaid. Imported Seed. Write for our best quantity prices.

JAPANESE TREE PEONY 日本牡丹

PEAONIA MOUTAN (牡丹)

(Tree Peony)

These immense beautiful and well known flowers from another source of Japanese pride, and are too well known to required description. The attention given to them in this country and Europe has resulted in the production of many notably fine new varieties which rank about first for lawns or flower borders or shrubby decoration. Sow Seed outdoors in well pulverized, rich and covering about one inch. Very slow germinate as will take 3, 4 months seedlings come out. With ordinary care, will bloom in third year, (Pkt. 25c.) PETUNIAS

Petunias grow with little attention or care and in any soil when once started and bloom profusely all spring and summer. The large, double varieties do not produce seed, but the pollen from them is artificially crossed on the large single, and fringed plants, and the seed so produced will make a percentage of double blossoms. The giant-flowered types produce large, single, plain edged or fringed-edged blossoms, or very thickly double flowers. As Petunia seed is exceedingly fine, start the seed in a box or flower-pot and merely press into the soil after sowing, cover with chopped moss, or sift a little sand over to cover, and, if possible, allow the water to soak up from beneath. The weakest looking plants will develop the handsomest flowers, so save all the plants carefully.

Petunia seed is very fine and very expensive; there is, therefore, but very little seed, almost like dust, in each packet

THE ROSE

December, January, February and March are the best months for planting but should the season be favorable you can still plant during the early part of April. The plants sent out during these months are what we call dormant two-year-old budded plants. Roses give best results when planted in a fairly sunny location and in good heavy sediment soil to which may be added some old manure or bone meal, but never use fresh manure. When planting straighten out all roots and as the dirt is filled in see that it is well packed around them; this keeps out the air and encourages a new growth of rootlets. Be sure that the Rose is planted so that the point where it is budded shall be just below the surface.

GLADIOLUS (グラジオラス)

The bulbs should be planted about 4 inches deep and 7 or 8 inches apart. Any good garden soil will make strong plants and good bloom, but a light application of any well decayed manure or good commercial fertilizer applied on the top of the ground after the plants are several inches high will aid in producing larger blooms. Keep the ground moist until the flower spikes begin to appear, then water freely. The bulbs should be taken up in the fall, after the leaves have become yellow, and then stored in a cool, dry place, free from frost. From December to April are the months to plant Gladiolous.

Japanese Giant Chrysanthemums 日本秋菊

The Chrysanthemum is the queen of autumn flowers. Nothing is more beautiful as house plants, in the late fall and early winter, than these large, fluffy, Japanese varieties. For massive blooms, grandeur of colors, ease of culture and certainty to flower there is no plant that will surpass them. The endeavor of nearly all growers has been, in late years, to introduce varieties which will produce the largest and finest blossoms for exhibition purposes. It is from these varieties that this seed is saved. These plants are easily raised from seed. Almost all the new and striking varieties are the result of plants grown from seed, and the amateur is as liable to originate new and splendid varieties as is the professional florist.

They are of the easiest culture and always give satisfaction as house plants. The blossoms you get will surprise you with the odd and beautiful forms of the flowers and abundance of bloom. If you want a magnificent collection of these gorgeous Chrysanthemums—red, white, yellow and pink—you will make no mistake in getting a packet of our select seed.

We sell the seed in packets only, and guarantee it to be from the genuine large flowered Japanese varieties, imported seed. Pkt., 25c; 3 pkts., 60c, postpaid.

Choice Chrysanthemum Plants

Set out the plants about 2 feet apart in well fertilized ground. After the young plants have grown 2 inches pinch them back about 4 inches, then each plant will send out from 3 to 4 stems. In order to give strength to the blossoms, cover the ground with a layer of an inch or two of decayed manure. As soon as the buds appear on the stems, let the largest remain and pinch off all others.

- Ready about May 1. (Each 20c.) (6 for \$1.00) postpaid.
- MAJOR BONNAFFON—Deep yellow, incurved.
- MEUDON—Immense pink, broad, long, drooping petals, full in the center.
- MRS. G. G. MASON—Clear-blood-red.
- PINK TURNER—Clear lavender-pink, incurved.
- WILLIAM TURNER—Pure white, incurved.
- YELLOW TURNER—Light yellow, incurved.

Tree and Shrub Seeds 庭木の種子

Most tree seeds are better sown in the latter part of winter or spring, though there are many that can be sown at any time, and some which must be sown while the seeds are quite fresh. Most kinds are best sown in boxes, of light, well-drained soil, covering the seed about its own depth or some of the larger ones a little deeper, press the soil down slightly with the hands. Keep in a lath house, frame, or some sheltered place and water carefully. As soon as large enough to handle, pot and grow on until large enough to plant in the open ground, where they are to remain. Pines and other Conifer seeds are best sown in March and April; use a soil containing plenty of decomposed granite and always water in the morning and not at night, as the young seedlings "damp off" very easily. Acacia seeds should be soaked in hot water for twelve hours or more before sowing.
